

This 2009 male Hypo Bloodred is coloring very well, and like most SMR Bloodreds, he will mature to be more red than orange (typical mature color for most hypo bloodres in the market). He loves frozen/thawed fuzzy mice and is just putting on his growth spurt. This particular male has such extreme hypomelanism, his eye pupils resemble those of albinos, but they are dark red, denoting that some melanin exists in this snake. Currently 32 inches long (as of 05-28-11).
