INVESTMENT PROJECT:

Pictured above is a pair of 2013 corns het for Scaleless Anery (not siblings). The male is the Tesseract and the female is the non-Tesseract. As with most corns, it's what's inside (genes) that matters most.

They are the products of pairing a Scaleless Anery to a Tesseract. The target value of this project will be the first Scaleless Anery Tesseract ever produced. While a Scale-less Anery Tesseract may seem genetically unlikely in one brood of babies from two triple-hets, it's not. Approximately half of the progeny from this couple will be Tesserases of some kind (Tesseract, Anery Tesseract, Scaleless Tesseract, and Scaleless Anery Tesseract). There aren't so many mutations in this marriage that hitting the target will be rare. It's likely that one or two of the babies from the first pairing could be the *trifecta*; Scaleless Anery Tesseract?

The male Tesseract is 24" long and the female non-Tesseract is 26" long, both eating one frozen/thawed large pinky or small fuzzy mouse every four to five DAYS. They should both reach breeding maturity in 2015 (or sooner).

They can be sold separately, but the price for this gender pair is \$3,500.00 usd, which includes. Separately, the male is \$2,500.00 and the female is \$1,500.00 usd with free shipping to lower- This Summer we will have many more like these, and other corns het for Scaleless and several other pattern and color mutation or morph compounds.

If interested in buying both of these snakes, please, ask for product SKU for the pair (corn snakes@aol.com).
