

Show & \$ell

{product id=875}

2013 male Pied-sided (P/S) Key Corn Snake. He is 27" long, eating frozen/thawed adult mice. This male is the progeny of one F2 Key Corn (aka: Rosy Ratsnakes) from the wild and the other parent was from the pairing of a Key Corn to a Diffused corn. I have hatched one of these out of every 15-20 siblings, so it's entirely possible that the lateral (and sometimes facial) random white could be the result of a new mutation. So far, these have very little of the lateral white patches we expect on P/S Bloodreds, but all have had the tell-tale white that is so common on the faces and necks of some P/S Bloodreds. His \$450.00 USD price includes shipping
