{product id=956}

2014 Male Pied-sided Bloodred Tessera corn snake. He has precious little lateral white, but enough to ensure that he possess the P/S (Pied-sided) gene mutation. That gene barely exhibited, he's very calm, and stunning in appearance. He is currently about 20" long, eating unaltered frozen/thawed medium to large pinky mice. His \$500.00 usd price includes ...

.

Different pose and lighting of the same snake. I hope we soon discover why most Bloodred Tesseras have such broken dorsal striping, which others (like this one) have beautifully contiguous dorsal striping?
