

#010113

Sunglow from Red Mask parent

Male

d.o.h. 2011

27" long on Dec. 29, 2012

In addition to being a stunning example of the Sunglow Morph, this 27" male from 2011 was sired by a Red Mask Motley corn. At this time, we believe the effects of the Red Mask mutation are dominant to wild-type - in the realm of inheritance. This one already demonstrates an exaggeration of red in both the markings and ground color zones. If he did not inherit the Red Mask trait, he promises to be a shockingly beautiful adult male.
