

The nice thing about new corn snake projects these DAYS is that we have such a huge inventory of morphs and mutations, there is ample opportunity for even a new-comer in the hobby to be the first to make a new mutation compound. This 2013 Tessera offers just such an opportunity. While no potential to be the first to produce a Scaleless Tessera, but perhaps the first for a Scaleless Anery Tessera since this male Tessera is het for Anery and Scaleless?

He is currently 30" long and weighs 152 grams empty. If he is not sold quickly, I'll put him on the 2015 SMR breeding roster since I fully expect him to be over 36" when I'm ready to breed snakes this Spring. Therefore, if breed him to a female with the same genes, the potential for the first Scaleless Anery Tessera is very good, since I have females with the same **genotype**.
