

Striped Tessera

Male

d.o.h. 2011

27" long on January 18, 2013

*This 2011 hatchling male Striped Tessera is now 27" long and eating frozen/thawed large fuzzy mice. Both parents are Striped Tesseras and he is also possibly het Amel. If he is a Super-form (aka: a homozygote) Striped Tessera, breeding him to any type of corn will result in 100% Tessera progeny.*
