

Striped Ghost Bloodred

Male

d.o.h. 2011

33" long on Jan. 25, 2013

Comments: Superior color and size maturity. He should breed in 2013. Good examples - like this one - show little or no visual evidence of being a striped pattern mutant, but when bred to Striped-type corns, progeny can be expected to exhibit visual stripes - except when bred to some Striped Bloodred types.
