

Show & Tell

In drafting the 2018 breeding roster it occurred to me that Lava Terrazzos have much more to offer new projects than even I imagined? Why virtually all Lava Terrazzos exhibit this hypo-esque coloration is fascinating. Not only do all of them exhibit semi-red pupils, but all exhibit this Hypo-Terrazzo *look*, instead of the deeper red I'd expect from the typical Lava mutation influence? Yes, many Lavas also have reddish pupils, but not all of them—unlike ALL Lava Terrazzos having them. They all have a common Lava ancestor, so this should suggest that the eye pupil color is a separate mutation, since some have redder pupils than others? . .
