

Show & \$ell

{product id=1894}

This is the last 2017 hatchling that I'm going to sell from this respective project. He is 21" long, eating large frozen/thawed pinky mice. In the past six months of maturity, he's showing more of the "Sunkissed" yellow that will take his looks closer to those of his parents, even though the mother is labeled not to be a Sunkissed homozygote? Father is a Sunkissed Anery and Mother is an Ultramel Anery Tessera so the double-mutant Anery Tessera progeny of this pairing are het for Sunkissed and either Ultra OR Amel. I cited "OR Amel" because the mother of this year's progeny being an Ultramel Anery, half of the babies from this pairing will be het for Ultra and Sunkissed and the other half will be het for Amel and Sunkissed—neither demonstrating which gene mutation they possess. If you buy this snake as an S.O.T.D. (product #1894) you save \$39.00 flat-rate shipping, but he is still being advertised on the Hatchling page of our web site as product #1735 which will add \$39.00

shipping to the listed price. His SOTD \$245.00 price includes [Parent Pics . . .](#)
