

## Show & Tell

Parents of this 2018 corn were both het for Scaleless Sunglow Motley, so I suspect this one to be a Scaleless Sunglow Motley. As we have seen, the Scaleless mutation seems to alter traditional Motley pattern, so because of the yellow circles near (and on) the tail, I think this one is a Motley (the broad pattern feature-less dorsal striping is NOT typical for Motley mutants). I expect (but do not know for sure) the soft orange markings to be more red/orange as an adult? If you're looking for a uniquely marked (and colored) Scaleless corn snake, here it is. I haven't even checked gender yet, but as soon as it feeds two more times, it will be available for purchase. That's when I will reveal the gender. I estimate sale publication for this snake on or near March 25, 2018. . . .
