

## Show & Tell

Arguably, no two organisms are identical (perhaps unless cloned), but in Scaleless corn snakes there is great variety in the location and volume of scalation. The relatively few scales they have are random in distribution and always smaller and misshapen, compared to typical corn snake scales. Note the top-dorsal longitudinal row of small scales on this 2015 hatchling, AND many other parallel rows on the posterior half of this snake. All Scaleless and Het Scaleless corn snakes in the hobby toDAY derived from the union of a Corn Snake to an Emory's Rat Snake so they are all inter-species hybrids.
