

Th

The parents of this corn snake are a Specter and a Coral Ghost. Out of the egg it demonstrated all of the specifications for a Specter/Heliconia, which is-at this time-classified as a variant of Coral Anery/Ghost types. In different words, no additional mutation has been identified in Specter corns (other than Anery-type and possibly a Red-modifying mutation? We'll show this snake-and others-as they mature, so you can all see any ontogenetic potential color changes.
