

## Show & Tell

A hatching Scaleless corn snake pic from last summer. Second pic is a SMR hatchling from 2015. No, this is not a Motley. Do you see the not-so-sharp egg tooth in the first pic? It's much more rounded and "dull" than most corn snake egg teeth?

note: ALL Scaleless corns in the hobby toDAY (including SCALED corns that are carriers of the Scale-less mutation-aka Het Scaleless) are descendants of the original pairing of a Corn Snake to an Emory's Ratsnake (aka: Great Plains Ratsnake) and are therefore technically inter-species hybrids. **Bonus pic**

< style="font-size: 12.16px;" />

No, this is not a Motley. Many (more than half) of all our Scaleless corn snakes have dorsal markings that resemble those of Motley mutants.
