

## Show & Tell

Not readily distinguishable from some of the Cayenne Fires, this homozygote (Super) Sunglow Motley corn snake is an adult female that I gratefully re-acquired from a customer who purchased her as a hatchling in 2014. Thank you, Joy. I love her. Some could argue that her high expression of red-from the Red Factor gene mutation-perhaps detracts from the beautiful pattern of most SMR Sunglow Motleys? While I confess that I miss not seeing overt pattern on this one, I'm much more interested in seeing how much red we can add to Sunglow Motleys, so this beautiful female will be active in breeding projects here next year. You did a GREAT job of raising her, Joy.
