

Show & Tell

This is the last Scaleless Sunglow Motley corn snake of the first 2018 season wave of eggs. I have one more shot at these again in a few months. Featured recently—describing that this scale-less version of a Sunglow Motley demonstrates that their pattern is the result of at least two dermal layers. We can see that there is less color and contrast in the scale-less version, compared to most of its scaled counterparts? BTW, at the time of this photograph, this snake had not yet shed her first skin. She was only four DAYS-old a few DAYS ago.

note: ALL Scaleless corns in the hobby toDAY (including SCALED corns that are carriers of the Scale-less mutation—aka Het Scaleless) are descendants of the original pairing of a Corn Snake to an Emory's Ratsnake (aka: Great Plains Ratsnake). Therefore, all Scaleless corns (and their scaled siblings) are inter-species hybrids. **BONUS PICs . . .**
