

Show & Tell

Here's what you get when you grudgingly decide not to breed a nice female Lava Terrazzo corn snake. Not unlike Chickens that lay eggs without fertilization by Roosters, these are infertile eggs that she-like most healthy adult female corns-lay even when they have no contact with a male. Note their smaller and more elongate shape, and their hugely-off-white or yellow coloration. This does not mean that fertile eggs this color are not fertile, but these are classic in size, shape and color for infertile corn snake eggs.
