

The *Snake-of-the-Day* headliner of this web site features photographs that we believe will interest our web site visitors. Each daily photograph will be posted at 11:00 am. central (GMT - 5) and replaced in 24 hours. Feel free to make *suggestions* regarding what snake photographs you would like to see in this daily feature. The animals pictured here are not for sale, unless otherwise noted, but you can find available surplus snakes for sale on the *Surplus Page* of this web site. We appreciate your patronage and welcome any *suggestions* you may have.

The eggs this Butter corn snake is in the process of laying are all inertile. I did not allow a male to breed her this year, so this is the result. It is not uncommon for a female corn snake who was not bred to lay a few fertile eggs that were inseminated from retained sperm along with mostly infertile eggs. The appearance and texture of these eggs demonstrate the marker for infertility. Usually, eggs that remain damp and shiny for many hours, are infertile, vs. most fertile eggs drying and losing their sheen within minutes of being laid.
