

Show & Tell

What makes the atypical black circles on the back of this Anery Motley is the polygenetic result of non-mutant gene interactions. These were originally called Hurricane Pattern Motleys because the black circles resemble the meteorological map symbol for Hurricane storms. I haven't paired any of my Hurricane Motley breeders for several years, but will make some of them later this summer. Note the dark, low-contrasting eye. The parents of this snake were both Anery AND Charcoal, so I believe this one to be both mutations, in addition to Motley, of course. **Bonus Pic . . .**
