

Show & Tell

This female corn (het for Cinder, Lava, and Sunkissed) was bred to a male with the same mutated genes. She laid her eggs on May 10th, and her sister should have laid a clutch around May 18th (writing this article on May 11th). Of course, hitting the jackpot of getting a Sunkissed Cinder Lava is unlikely, but there should be some interesting almost "jackpot" genotypes in these clutches? **UPDATE BONUS PIC . . .**
