

## Show & Tell

Here is one of the two 2014 Hurricane Anery Motley corns that hatched this year with geometrically rectangular dorsal *patches* between markings (I shared a brood shot of this one with siblings on May 16, 2014). Since only two of the eleven eggs yielded Motleys with these non-ovular zones between markings, there is a strong likelihood that they are the result of a gene mutation. Future breeding trials will tell the story. [Bonus Pics . .](#)
