This 2010 female Corn Snake is currently 45" long, eating frozen/thawed adult mice. Acquired from my dear friends John and Bridgett Bernardi in El Paso, this female COULD be a Buf mutant. When he sent me some of these as hatchlings years ago, he said he could not identify their respective mutation, but felt very strongly that they were dominant to wild type (as revealed by phenotypic evaluation of Punnett Squares). I bred her a few years ago to an Okeetee and believe that I could distinguish between ones looking like Buf mutants and their Okeetee siblings. I'm not certain enough to make that claim, so I'm selling her for the price of a good-looking common corn of prime breeding age. Her \$185.00 price includes
