

Show & Tell

Adult Scaleless male produced by Chip Bridges. Breeding trials next year will reveal if this is actually a Saleless Lavender mutant. So far, all of the Scaleless Lavenders have not demonstrated the namesake Lavender coloration, presumably because the iridiphores that render the namesake color in scaled individuals are contained in the missing outer epidermal scale layers of the Scaleless individuals? That said, since the few dark scales showing in the tail and head area on this snake are not lavender colored, this may be a Scaleless corn snake that is not a color mutant?
