

The Snake-of-the-Day headliner of this web site features photographs that we believe will interest our web site visitors. Each daily photograph will be posted at 11:00 am. central (GMT - 5) and replaced in 24 hours. Feel free to make **suggestions** regarding what snake photographs you would like to see in this daily feature. The animals pictured here are not for sale, unless otherwise noted, but you can find available surplus snakes for sale on the **Surplus Page** of this web site. We appreciate your patronage and welcome any **suggestions** you may have.

Shooting images like this (subjects NOT in repose) could make a person old before their time. Those of you who have shot groups of hatchling corns know what I mean. This is a brood of corns from a pair of Plasmas (Lavender Bloodreds) I got from John Finsterwald (Zorro) a few years ago. Both parents are het for Charcoal and Hypo, but some of these babies are not as easy to identify as I'd envisioned. It's *almost* easy to discern the Hypo Plasmas, and *some* of the Lavender Pewters are *ALMOST* obvious. Well . . . in short . . . I have NO idea who's who. Since I've seen some Hypo Plasmas that were darker than non Hypo Plasmas, and vice-versa, I'm not so concerned with distinguishing between those. It's the Charcoal **phenotypes** I'm interested in identifying. Hopefully, the reddish pupils of most Lavender types will be trumped by the dark eyes of Charcoals - in the target morph compounds? I'll be soliciting Zorro's assistance in identification, but if anyone else has experience with hatching similar Plasma+Charcoal mutant compounds, I'm all eyes and ears. Send your opinions to [Cornsnakes@aol.com](mailto:Cornsnakes@aol.com). Advanced thanks to those who can identify visual markers on these neonatal corns.
