

Show & Tell

Not a brightly colored Bloodred, this female just laid 16 eggs that were sired by a male with her hidden genes; Pied-sided Anery Bloodred, but the twist is that their grandfather was the famous white-sided Granite owned by Rich Hume. Fingers crossed. No, she's not really brighter in color on the 1st third of her body. A light directly above her head was not properly diffused so it was brighter than the other lights, making her look brighter only on that part of her body.
