

The Snake-of-the-Day headliner of this web site features photographs that we believe will interest our web site visitors. Each daily photograph will be posted at 11:00 am. central (GMT - 5) and replaced in 24 hours. Feel free to make **suggestions** regarding what snake photographs you would like to see in this daily feature. The animals pictured here are not for sale, unless otherwise noted, but you can find available surplus snakes for sale on the **Surplus Page** of this web site. We appreciate your patronage and welcome any **suggestions** you may have.

Anery and Amel Palmettos. It appears that the Anery types of Palmettos (Charcoal and Anery A) show more (if not all) of their color smudges and flecks as hatchlings, where as the Amel types of Palmettos show few of the color flecks and smudges they will have when they're mature. Since regular Palmettos have many more visible color flecks when mature, compared to when they were hatchlings, and since red flecks are the ones they gain more of throughout maturity, it makes sense that Amel Palmettos would start out showing so much less color than their non-Amel Palmetto counterparts. Shrugs?
