

Show & Tell

Another 2015 brood of Graham Criglow's ZagTec corns (perfected by Kasi Lodgigue). Their pattern "aberrancy" is not attributed to a gene mutation, but to polygenetics (renderings of interactions between genes). The morph name is a combination of the morph names ZigZag and Aztec, neither of which officially denote visible pattern namesake in Zagtecs. I guess we could say that each of those patterns that has been demonstrated in both of those polygenetic hobby morphs, little of either of which are obvious. After at least two consecutive feedings of unaltered, frozen/thawed pinkies, they will be offered for sale on our web site.
