

Show & Tell

The parents of this 2014 adult male Amel were both Banded Fluorescent corns, but this one didn't inherit enough banding—and his ground color zones are too “dirty”—to call him a Fluorescent. I'll breed him back to a Fluorescent or a Reverse Okeetee next year to see if he has any hidden traits he'll pass-on to his progeny? I'm hoping to at least send these red markings up his next family tree?
