

## Show & Tell

Produced by Darren Bennett (DGB Geckos in Scotland), this Gravid Trans Pecos Ratsnake (*Bogertophis subocularis*) should lay her eggs before the end of August? She is possibly het for the Striped gene and was bred to a Striped male Suboc. Subocs are best maintained in well ventilated caging, so this one is in a Freedom Breeder. The moss at the back of the bin is dry in this pic, but I dampen it every other DAY, in case she unexpectedly lays her eggs off-schedule.
