

Well, all I can say for sure is that this Albino is the product of pairing a Striped Amel Java to a Striped Java Het Amel. Now, nearly 30" long, she seems to be demonstrating the latent de-pigmentation we see in Sunrise Amel mutants that are also pattern mutants (*stripe* in this case). One more puzzle attached to our quest to identify the inheritance of the mysterious Java *?mutation?*. The overall color seems parallel to many Kastanie Amels (Mandarin Corns), but of course, also what we expect to see in many Creamsicles. Are Javas unique mutants or something else?
