Ultramel Tessera

Female

d.o.h. 2010

36" long on October 8, 2012

Possibly Het Anery

\$550.00 shipped

This female Ultramel Tessera is now 36" long, eating frozen/thawed small to medium adult mice. She offers great genetic potential when bred to any non-Lavender red-eyed corn snake. Since the Ultra gene mutation is codominant with Amelanism, by breeding this feamale to any Amel corn, approximately 1/2 of the progeny will be Amel and the remainder of them will be Ultramels. Since Tessera is a dominant trait, approximately 1/2 of the progeny will be Tesseras. Therefore, approximately 1/2 of the Amels will be Tesseras and approximately 1/2 of the Ultramels will be Tesseras.

Comments: Superior color and size maturity.

Re: Ultra mutation involved in this mutation compound:
