Details

toDAY's SNAKE of the DAY (Sat. Dec.01, 2012)

#120112

Striped Anery (possibly also Tessera and Dilute)

Male

d.o.h. 2011

24" long on Nov. 30, 2012

\$200.00 SHIPPED

Comments: From the *Scratch and Dent* department, this 2011 male Striped Anery has a dorsal spinal enlargement. His parents were both het for the Dilute mutation, so he is possibly a Blue Striped corn and I even believe him to be a Tessera since his father is a Tessera het Dilute Anery Motley (aka: Blue Motley). Obviously, were I certain of that genotype, he would be much more expensive, so this is a rare opportunity to pick up a potentially rare corn at a very low price.

He eats normally and has never been ill a DAY in his life. The spinal anomaly is the same proportional size it was when he hatched, so I don't expect it to become any more obvious than it currently is. In fact, most spinal anomalies like this actually appear smaller with the dorso-lateral growth of musculature in that part of the body.

Also - from my experience with such anomalies/malformities - I do not expect this anomaly to have any deleterious impact on his life. He eats large frozen/thawed fuzzy mice and has never had a lapse of appetite or ability to digest. His temperament is typically corn snake, in that he is curious and has never demonstrated the slightest repulsion to being handled. I have never known such an anomaly/malformation to be heritable. We believe such anomalies occur during embryology and are akin to injuries any animal incurs in its life.

The bubble view in the upper-right corner of the above picture demonstrates the geographic location of the spinal anomaly and in the upper-left corner, the extent of the spinal protrusion. If nobody buys him, we're going to breed him to a Blue Motley (Dilute Anery Motley) in 2013 to find out if he's a Tessera. He had several Tessera siblings and from the perfection of shape and contiguity of his striping, I stop just short of declaring that his is actually a Striped Blue Tessera. His father is a Tessera Het Striped Blue Motley and his mother was het for

Striped Blue Motley.

NOTE: In so much as no two computer monitors render colors the same, the colors, shades, tones, and hues of the snakes pictured on our site have been meticulously evaluated and declared to match those of the respective snake for sale (via MY computer monitors).

This snake is in good health (not under or over-weight, no parasites or diseases that we are aware, no injuries or defects, and routinely feeding on unaltered frozen/thawed mice).

If we had noticed that the snake listed has any temperament or behavioral issues other than human-friendly, they would have been detailed in Comments above.
