

MERRY CHRISTMAS

SHOW & TELL

Two 2014 sibling hatchlings with the Red Mask mutation that is dominant to wild-type. The Coral colored one is a Super Salmon Snow that has both copies of the RM gene mutation, causing him to be very deeply colored. The Anery has only one copy of the gene mutation so it is a Visual Het that doesn't exhibit much of the color expression of the gene. In the case of both, within the next two years they will continue to have heightened expression of the pink/coral color gene. . . .
