Show & Tell

This beautiful Trans-pecos Ratsnake demonstrates two of the few mutations of its species in the hobby toDAY, Amelanism (Albinism) and Blonde. The non-classical pattern is the expression of the pattern mutation, Blonde. There are two different alleles of Albino TP Rats so far. This one is a descendant of the Soderberg line, demonstrated by the missing frontal scale on the top-center of the head. The other Albino TP Ratsnake allele is not missing that frontal scale.
