

Adult male *Striped* Champagne Snow Cornsnake. His \$175.00 price includes

At 37", he is eating frozen/thawed adult mice. For a Champagne Snow morph, he's typical, but it's difficult to call him a Striped corn. If you breed him to any Striped corn, you will get varying degrees of striped progeny. In other words, he is a Striped mutant, but displays little or no striping (typical in the Champagne family of Snows). The Champagne family is one of the Coral Snow types. Therefore, he has one or both copies of the so-called Red Mask gene mutation. d.o.h. 08-13-10
