

Striped Snow (no aka)

Most Commonly Used Name: Striped Snow

Mode of Genetic Inheritance: Recessive

Type: Triple mutation compound (Stripe + Amel + Anery)

Eye Color: Red pupil

Combining the three recessive gene mutations; Stripe and (Anery & Amel = Snow) renders these beautiful Striped color mutants.

What to expect:

Both male and female hatchlings look alike (essentially pink or white snakes with slightly darker pink or white striping), and adults are essentially larger versions of that color scheme, except for possessing carotenoid yellow they develop as they mature.

SURPLUS section of this web site). We do not provide pictures of individual hatchling snakes for sale, nor do we recommend that you ever choose a new pet based on an image of its neonatal form. Corns change so dramatically from hatchling to adult, they will NEVER have the same colors or contrasts throughout maturity. While most of the snakes we produce will mature to resemble the featured adult image(s) on our web site, unlike manufactured products that are respectively clones of each other, the nature of polygenic variation results in each animal being similar but not identical to others of its morph. The snake we select for you may not mature to be identical to the pictured examples, but will be chosen based on our experience of observing which neonates will mature to properly represent their respective morph. We take this responsibility very seriously, and therefore publish the guarantee that we will exchange your SMR snake if it does not mature to be like our advertised examples.
