2017 male 15" Striped Sunkissed corn snake. Where are the Stripes? While not exhibited on this Striped mutant, if you breed this male to any visibly Striped corn snake mutant, 100% of the progeny will be Striped mutants. Sunkissed is known to break Stripe and Motley rules by allowing some belly markings/checkering; something that does not happen in most Motley or Striped mutants of most colors (not utterly rare, but seen also in some Lavender Motleys and Stripes). His \$175.00 USD price includes **S O L D Bonus PIC . . .**

Belly pic showing atypical ventral markings for a Striped mutant corn, but not so rare for Sunkissed Motley and Striped mutants. No, this snake has no Tessera branches in his family tree.
