If you have a male Specter this 17" female 2018 Anery Tessera corn snake is quite the opportunity to make Tessera Specters. She is currently eating frozen/thawed medium pinky mice. Her parents are a Specter and a Striped Anery Tessera with NO hets. Anyone who questions the inheritance of most red-modifying mutations (except for RedCoat) in corn snakes could not explain the faint pink cast to her dorsal striping. Her mother (Striped Tessera) is a third generation Tessera and has never had any red-modifiers in her family tree, so the blush of pink toDAY's SOTD demonstrates (which will intensify in color through maturity) was inherited by whichever red-modifier is in his Specter father. \$400.00 plus \$39.00
