

{product id=942}

The nice thing about new corn snake projects these DAYS is that we have such a huge inventory of morphs and mutations, there is ample opportunity for ANYONE to be the first to make a new mutation compound. This 2013 Tessera offers just such an opportunity. Well, perhaps not potential for the FIRST, but close enough. This male Tessera is het for Anery and Scaleless.

He is currently 30" long and weighs 152 grams empty. If he is not sold, I fully expect him to be over 36" when I'm ready to breed snakes for 2015 production. Therefore, if bred to a female with the same genes, the potential for the first Scaleless Anery Tessera is very good. Even if someone hasn't got a genetic match for this snake, there is great potential for making good money in just a few short years. If you don't have a female that's het for Scaleless, breeding this Tessera to any Anery corn will render some Anery Tesseras (in addition to classic Tesseras and classic Aneries). Because some of those will also be het for Scaleless, one need only hold back all of the females to raise and bred back to their father; this snake OR one like him. Some of them won't be het for Scaleless, but even without a female that matches this snake's genome, this would be the quickest way to get Scaleless Tesseras and/or Scaleless Anery Tesseras. His \$1,500.00 price includes
