

28" long now, this female Tessera is het for snow. She is currently eating frozen/thawed hopper mice, so reaching a good breeding size by Summer, 2012 should be no problem. By breeding her to any Snow Corn, you should produce Snows, Snow Tesseras, Amels, Amel Tesseras, Aneries, Anery Tesseras, Tesseras, and normals, and those are only the known hets. Stripe is a commonly hidden trait in most Tesseras toDAY.
